Unit

KRUUSE Large Bore IV Administration Set

Large animals such as horses and cattle may require tremendous amounts of IV fluids during a short period of time. Conventional smaller IV sets cannot meet the fluid demands of eg a 600 kg horse.

The KRUUSE Large Bore IV Set increases flow rate up to 30 l per hour. This volume is necessary in severe colic and critical care emergencies.

The diameter of the KRUUSE Large Bore system is twice the diameter of conventional IV drips. This translates into 16 times the flow rate of the conventional sets.
